

Syringa Vulgaris

Common Lilac

Non-Native

S

Notes: Syringa vulgaris is a common landscape plant that makes a great hedgerow when planted 5ft on center. It is prone to powdery mildew when it is not planted with room for air circulation but is otherwise very hardy. It should be planted in well draining soil as it does not like its feet to remain wet.

Leaves - Leaves are cordate (heart shaped), matte, and entire. They are opposite and thick.

Buds: The buds of the Syringa Vulgaris are distinct because the terminal buds are paired.

Bark

Syringa vulgaris have a very distinct flower and seed pod that are easy to identify.
